PROBLEM-SOLUTION FIT CANVAS 2.0

Team ID: SWTID-2026-1398

Project: Import Data Using Transform Maps

Date: 30 September 2026

1 CUSTOMER SEGMENT(S)

Target Roles:

- ServiceNow System Administrators
- HR Data Operations Managers
- IT Service Management (ITSM) Leads

Context:
Enterprise HR/IT teams managing large volumes of employee onboarding, transfers, and organizational updates.

2 JOBS-TO-BE-DONE / PROBLEMS

Key Requirements:

- Bulk update employee records efficiently.
- Seamlessly insert new hire profiles without creating duplicate entries.
- Map disparate external spreadsheet fields (ID, Name, Email, Dept, Location) to ServiceNow schema.

3 TRIGGERS

Primary Triggers:

- Mass onboarding events or company-wide re-organizations.
- Periodic HR data synchronization from external legacy systems.
- Manual entry backlogs causing operational delays in user provisioning.

4 EMOTIONS: BEFORE / AFTER

Before: Frustrated by tedious manual typing, anxious over duplicate account errors, overwhelmed by legacy data inconsistencies.

After: Confident, efficient, and reassured by automated validation and clean database records.

5 AVAILABLE SOLUTIONS

Existing Alternatives:

- Manual single-entry record updates via forms (slow & error-prone).
- Custom REST API script integrations (complex & high maintenance).
- Direct database SQL injections (risky & bypasses business logic).

6 CUSTOMER CONSTRAINTS

Operating Limits:

- Strict security policies restricting direct DB write access.
- Varying spreadsheet column header naming conventions.
- Limited developer bandwidth for custom script maintenance.

7 BEHAVIOUR

Current Actions:

- Admins regularly pre-clean Excel files before uploading.
- Manually search for existing Employee IDs to verify duplicates.
- Maintain offline tracking sheets for bulk personnel movements.

8 CHANNELS OF BEHAVIOUR

8.1 Online:

- ServiceNow System Administration Console
- Import Set & Transform Map Workbench

8.2 Offline:

- Exported CSV/XLSX spreadsheets from HR departments

9 PROBLEM ROOT CAUSE

Root Issue: Disconnected systems producing unstructured bulk data without built-in automated schema validation or unique key deduplication prior to database commitment.

10 YOUR SOLUTION: AUTOMATED TRANSFORM MAP PIPELINE

1. Temporary Staging Area:
Upload Excel files into an *Import Set Table* for pre-commit parsing and validation without affecting target records.

2. Transform Map Configuration:
Map spreadsheet attributes (Employee ID, Name, Email, Department, Location) directly to target Employee table schema.

3. Coalesce Key Deduplication:
Set `Employee ID` as the unique identifier—automatically updating matched profiles while inserting brand-new employees.
